What's New In DiskState?

It only takes you a second to say, "no way, I'm not giving that. I'm leaving that for Windows." Well, that's a tough thing to do if you're one of those people who don't want to use Windows to take care of storage on your computer. For those people, there's DiskState. The application was specifically developed to do just that: Make sure the drive gets analyzed, is in good shape, and is safe. When you're done with the scan, the application can be ordered to have the drive or storage device automatically removed by

using the disc ejection button. Doing that will automatically open the Windows OS disc manager to remove the drive and release the device. The following steps are taken: First, your scanner is detected and you are asked if you'd like to enable automatic removal. After you do, DiskState will open the Windows OS disc manager and automatically eject the disk. Click Go. That's it. DiskState made the job easier by making it seem so simple. The scan process can take from a few minutes, to over an hour, depending on the size of the target drive and your internet connection speed. After finishing the scan, you're offered the different options shown above. DiskState can take care of anything from analyzing filesystems, to finding duplicate files. It can also be ordered to have the disk detached, which is best handled by the Windows OS disc manager. DiskState also makes it possible to have the drive automatically removed. Simply click Go to have it ejected. DiskState provides a comprehensive range of features that make it easier to take care of your computer's storage. The tool is easy to use, and can be used from any Windows computer. OS: Windows Minimum: XP, Vista, 7 Applies To: All Welcome to the forum community.
